Office Action Summary

Application No.

10/509,323

Applicant(s)

MATSUNO ET AL.

Examiner

Mina Haghighatian

Art Unit

1616

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 04/09/10.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-4 and 10-15 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☐ Claim(s) _____ is/are rejected.
- 7) ☒ Claim(s) 1-4 and 10-15 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☒ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1448 or PTO-600) Paper No(s)/Mail Date _____
- 4) ☐ Interview Summary (PTO-413) Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____

DETAILED ACTION

Receipt is acknowledged of the Amendments, Remarks and Terminal Disclaimer filed on 04/09/2010. Claim 1 has been amended and new claim 15 has been added while no claims have been cancelled. Accordingly claims **1-4 and 10-15** are pending.

Terminal Disclaimer

The terminal disclaimer filed on 04/09/10 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of **6,638,538** and **6,387,413** has been reviewed and is **accepted**. The terminal disclaimer has been recorded.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-4 and 10-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miyata et al (WO 9910385, as evidenced by US 6,387,413) in view of Collins et al. (US Pat. 6,096,728).

Miyata et al teach a gel made of hyaluronic acid alone which is hardly soluble in a neutral aqueous solution (see abstract). The said hyaluronic acid gels are prepared by freeze-thawing method (see col. 7, line 42 to col. 8, line 15). The hyaluronic acid gel obtained according to the disclosed method, are used as a general biodegradable biomedical material in any fields wherein hyaluronic acid is used without any particular restriction. It may be used for example, as an adhesion preventive, **a carrier for a pharmaceutically active substance, a medicinal composition**, a wound dressing, etc (see col. 8, lines 45-55).

Miyata et al further teach that "When formulated appropriately, a pharmaceutical which can release a pharmacologically active substance in a desired way can be obtained. The slow release pharmaceutical may be administered orally, percutaneously, permucocutaneously, by injection or by implantation" (see col. 9, lines 14-18). In Example 1, a hyaluronic acid gel is prepared using a freeze-thaw method and the pH of the formulation is at 6.

Miyata et al, teach addition of pharmaceutically active agents, but lacks disclosure on antibiotics being the active agent. This deficiency is cured by Collins et al.

Collins et al. disclose the combination of a drug substance and cross-linked hyaluronan gels and that the drug can be used to treat inflammatory conditions of a joint such as gentamicin, vancomycin and structurally related antimicrobials (Column 7, lines 10-19, Column 28, lines 31-38, Column 32, lines 34-50).

It would have been obvious to one of ordinary skill in the art at the time the invention was made, given the general teachings of the formulations of Miyata et al comprising a cross-linked hyaluronic acid gel and active agents, to have looked in the art for specific active agents such as antibiotics for combination with the formulations of Miyata et al, as taught by Collins et al with reasonable expectation of successfully preparing a formulation that effectively delivers the active agents to the site of action. In other words, all the claimed elements were known in the prior art and one skilled in the art could have combined the elements as claimed by known methods with no change in their respective functions, and the combination would have yielded predictable results to one of ordinary skill in the art at the time of the invention. Therefore, the claimed invention, as a whole, would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made, because every element of the invention has been collectively taught by the combined teachings of the references.

Claims 1-4, 10-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miyoshi et al (WO 0027405, as evidenced by its US 6,635,267) in view of Collins et al. (US Pat. 6,096,728).

Miyoshi et al 'US '267 teach a gel made of **hyaluronic acid alone** which is hardly soluble in a neutral aqueous solution and has fluidity enough to be easily ejectable from an injector (see abstract). The molecular weight of the HA to be used in the present invention is preferably within the range of from about 1×10^5 to about 1×10^7

Art Unit: 1616

Daltons (see col. 6, lines 6-10). The HA gel according to the invention can be solubilized through degradation by treatment under accelerating conditions for acid hydrolysis of HA (see col. 6, lines 29-33). It is also disclosed that "If pharmaceutically or physiologically active substances are added at the time of gelation, the resulting fluid HA gel contains these substances in it" (see col. 8, lines 34-43). Miyoshi lacks disclosure on combining the HA gel with antibiotics. This deficiency is cured by Collins et al.

Collins et al. disclose the combination of a drug substance and cross-linked hyaluronan gels and that the drug can be used to treat inflammatory conditions of a joint such as gentamicin, vancomycin and structurally related antimicrobials (Column 7, lines 10-19, Column 28, lines 31-38, Column 32, lines 34-50).

It would have been obvious to one of ordinary skill in the art at the time the invention was made, given the general teachings of the formulations of Miyoshi et al comprising a cross-linked hyaluronic acid gel and active agents, to have looked in the art for other and specific active agents such as antibiotics for combination with the formulations of Miyoshi et al, as taught by Collins et al with reasonable expectation of successfully preparing a formulation that delivers the active agents to the site of action. In other words, the claims would have been obvious because the substitution of one known element for another would have yielded predictable results to one of ordinary skill in the art at the time of the invention. Therefore, the claimed invention, as a whole,

Art Unit: 1616

would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made, because every element of the invention has been collectively taught by the combined teachings of the references.

Claims 1-4, 10-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kawata et al (WO 0157093, as evidenced by its US 7,014,860) in view of Collins et al. (US Pat. 6,096,728).

Kawata et al teach production of hyaluronic acid gel which comprises keeping hyaluronic acid in water at a hyaluronic acid concentration of at least 5 wt% in the presence of an acid component in an amount at least equimolar with the carboxyl groups in the hyaluronic acid (see abstract). It is disclosed that "The present invention provides a hardly water soluble hyaluronic acid gel made of **hyaluronic acid alone** with transparency. The hyaluronic acid gel according to the present invention retains the structure of the biologically inherent hyaluronic acid by virtue of **obviation of use of crosslinkers, and is excellently safe and biocompatible.** Therefore, it is useful as a biomedical material such as an injection for treatment of arthrosis, an embolizing material, an injection for a soft tissue and an artificial vitreous body" (see col. 6, lines 22-30).

Kawata et al also discloses that the molecular weight of the HA to be used in the present invention is preferably within the range of from about 1×10^5 to about 1×10^7 Daltons (see col. 6, lines 62-67). The HA gel according to the invention can be

Art Unit: 1616

solubilized through degradation by treatment under accelerating conditions for acid hydrolysis of HA (see col. 7, lines 31-36). Kawata et al lacks disclosure on combining the HA gel with antibiotics. This deficiency is cured by Collins et al.

Collins et al. disclose the combination of a drug substance and cross-linked hyaluronan gels and that the drug can be used to treat inflammatory conditions of a joint such as gentamicin, vancomycin and structurally related antimicrobials (Column 7, lines 10-19, Column 28, lines 31-38, Column 32, lines 34-50).

It would have been obvious to one of ordinary skill in the art at the time the invention was made, given the general teachings of the formulations of Kawata et al comprising a cross-linked hyaluronic acid gel and active agents, to have looked in the art for other and specific active agents such as antibiotics for combination with the formulations of Kawata et al, as taught by Collins et al with reasonable expectation of successfully preparing a formulation that delivers the active agents to the site of action. In other words, the claims would have been obvious because the substitution of one known element for another would have yielded predictable results to one of ordinary skill in the art at the time of the invention. Therefore, the claimed invention, as a whole, would have been *prima facie* obvious to one of ordinary skill in the art at the time the invention was made, because every element of the invention has been collectively taught by the combined teachings of the references.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims **1-4 and 10-15** are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-8, 18-21 of U.S. Patent No. **7,014,860** in view of 6,096,728 (Collins et al). An obviousness-type double patenting rejection is appropriate because while the conflicting claims are not identical, the examined claims are not patentably distinct from the reference claims because the examined claims would have been obvious over the reference claims in view of 6,096,728 (Collins et al).

Here, instant claims are drawn to a composition comprising an antibiotic and a hyaluronic acid and/or a hyaluronic acid gel, wherein the hyaluronic acid gel is crosslinked hyaluronic acid made of hyaluronic acid having a weight average primary

Art Unit: 1616

molecular weight greater than 800,000 wherein the hyaluronic acid gel is prepared by dissolving hyaluronic acid in an aqueous solution at an acidic pH with no crosslinkers to form the hyaluronic gel and wherein the antibiotic is added to the formed hyaluronic gel.

The reference claims are drawn to a biomedical material which contains a transparent gel consisting of hyaluronic acid or a salt thereof; a second acid or a salt thereof; and water; wherein the transparent gel does not contain any cross-linkers, and wherein the hyaluronic acid gel dissolves in a neutral aqueous solution.

The difference is that the reference claims do not recite or require the addition of an antibiotic to the gel. Collins et al remedies this deficiency. Collins et al teach a composition comprising hyaluronic acid and active agents such as antibiotics for effective drug delivery to the sites. It would have been obvious to one of ordinary skill in the art to have implemented the teachings of Collins et al on the addition of an antibiotic to the formulations of the reference claims with reasonable expectation of successful delivery of active agents to the desired site of action.

Claims **1-4 and 10-15** are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-16 of U.S. Patent No. **6,635,267** in view of 6,096,728 (Collins et al). An obviousness-type double patenting rejection is appropriate because while the conflicting claims are not identical, the examined claims are not patentably distinct from the reference claims because the examined claims would have been obvious over the reference claims in view of 6,096,728 (Collins et al).

Here, instant claims are drawn to a composition comprising an antibiotic and a hyaluronic acid and/or a hyaluronic acid gel, wherein the hyaluronic acid gel is crosslinked hyaluronic acid made of hyaluronic acid having a weight average primary molecular weight greater than 800,000 wherein the hyaluronic acid gel is prepared by dissolving hyaluronic acid in an aqueous solution at an acidic pH with no crosslinkers to form the hyaluronic gel and wherein the antibiotic is added to the formed hyaluronic gel.

The reference claims are drawn to a hyaluronic acid gel comprising water and hyaluronic acid, wherein the said hyaluronic acid is not in the form of a complex with cationic polymer and wherein the gel is auto cross-linked.

The difference is that the reference claims do not recite or require the addition of an antibiotic to the gel. Collins et al remedies this deficiency. Collins et al teach a composition comprising hyaluronic acid and active agents such as antibiotics for effective drug delivery to the sites. It would have been obvious to one of ordinary skill in the art to have implemented the teachings of Collins et al on the addition of an antibiotic to the formulations of the reference claims with reasonable expectation of successful delivery of active agents to the desired site of action.

Response to Arguments

Applicant's arguments filed 04/09/10 have been fully considered but they are not persuasive.

Applicant argues that unlike the disclosure of Miyoshi et al '267 and kawata et al '860, the HA gel of present claims is intended to hold the antibiotic and releases the antibiotic by its biodegradation. In contrast, the HA gels of Miyoshi and Kawata are transparent HA gels with fluidity and are not designed to hold antibiotics and release antibiotics by their degradation. This argument is not persuasive because instant claims are drawn to "a composition comprising hyaluronic acid gels and an antibiotic". The release of the medication is not claimed and would not be a patentable limitation in a product claim. Both references teach compositions comprising hyaluronic acid gels and a therapeutically active agent. Collins teaches combination of hyaluronic acid and an antibiotic for treating infections. Furthermore, as Applicant stated, in the instant claims the HA gels are "intended" to hold an antibiotic. It is respectfully pointed out that a recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish from each other. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. See *In re Casey*, 152 USPQ 235 (CCPA 1967) and *In re Otto*, 136 USPQ 458, 459 (CCPA 1963). Thus, the intended use of a composition claim will be given no patentable weight. It has been shown that the references teach the same HA gels and the same method of preparing them. Thus it would have been expected that the HA gels of the instant claims have the same structure and properties as those described by the prior art.

The intended use of the claimed composition is not given patentable weight, because the prior art compositions would be at least capable of performing said use.

With regards to the rejection of claims under obviousness Double Patenting over Miyoshi and Kawata ('267 and '860 patents), Applicant argues that, the instant claims require HA gels that are intended to hold the antibiotic and release the antibiotic by its biodegradation. In contrast, Applicant continues, the HA gels of Miyoshi '267 and Kawata '860 are transparent HA gels with fluidity, good biocompatibility and improved *in vivo* persistency and not designed to hold antibiotics and release antibiotics by their biodegradation.

The arguments are not commensurate with the scope of claims. It is noted that neither sets of claims are drawn to a method of drug release, but to a formulation comprising a hyaluronic acid and an active agent. Thus it has been shown that the reference claims would have rendered the instant claims obvious.

No claim is allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mina Haghighatian whose telephone number is (571)272-0615. The examiner can normally be reached on core office hours.

Art Unit: 1616

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Johann Richter can be reached on 571-272-0646. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
